

Three overlapping teal circles are positioned horizontally across the page. The central circle is fully visible, while the circles on the left and right are partially cut off by the edges of the frame. The text 'Gaia Corradeschi' is centered over the middle circle.

Gaia Corradeschi

Portfolio

About me

I am a Product and Interaction Designer with experience across UX research, visual design, and cross-functional collaboration. Trained at Politecnico di Milano and Tongji University, I have worked in a corporate UX research team at BNP Paribas Fortis and on independent design projects.

I bring both analytical and visual sensibility — I'm as comfortable synthesizing research findings as I am developing visuals or designing a presentation. I'm now looking to join a dynamic environment where I can keep learning, take on new challenges, and grow alongside the work I contribute to

Visual & Graphic Explorations

MOODBOARD VISUAL DESIGN ILLUSTRATION

These works reflect my approach to visual storytelling, composition, and trend sensitivity — skills I apply across both independent projects and design team contexts.

Material, Color & Texture Moodboarding

Applied research on visual trends, fabric patterns, and aesthetic concepts to define visual direction, communicate aesthetic intent, and support creative briefing processes.

Moodboard exploring bold pattern, material texture, and product-focused visual energy. References: Italian industrial design, surface design, editorial collage.

Moodboard exploring minimal geometry, light, and material contrast. References: contemporary interior and product design, graphic composition.

This moodboard establishes the aesthetic and conceptual direction for VERA, a smart home gateway ecosystem. It draws inspiration from the organic, balanced geometry of river stones, using smooth pebble-like forms to define the product's physical design. The arrangement of stones in varying sizes visually represents the system's hierarchical 'mother and child' architecture. To envision user interaction, the backlit, glowing circles illustrate how the device comes to life through 'breathing' modular light pulsations. The fluid white textures and deep cobalt blue gradient define a premium, nature-infused color and material palette for the entire product family.

This moodboard frames the aesthetic and conceptual direction for ORIBag, a next-generation urban luggage concept designed for Samsonite's vision of human mobility in 2030.

The visual narrative evokes a fast-paced, hyper-connected reality of future megacities, establishing the need for seamless, stress-free commuting. At the core, the geometric pattern symbolizes the bag's innovative auxetic material technology, evoking an expandable, shock-absorbing structure that physically transforms to adapt to the user's changing space needs. This technical flexibility is integrated with an aura of precision engineering, ergonomic luxury, and a premium active lifestyle, ultimately capturing a travel companion designed to effortlessly alleviate the friction of future urban life.

This moodboard captures the empathetic and therapeutic essence of Chef, an IoT smart hardware system engineered to guide individuals with Alzheimer's through procedural kitchen tasks, reducing stress, preserving user dignity, and supporting autonomy through gentle, non-intrusive interaction.

The aesthetic framework prioritizes absolute familiarity and user acceptability, utilizing comforting archetypal forms and rooted cultural anchors to mitigate disorientation. The design language champions a disappearing technology philosophy, where advanced smart components seamlessly recede into classic, tactile materials like natural wood and refined metals, emerging only as instinctive, glowing light interfaces to guide user actions.

Data-informed UX/UI & Service Design

001 Love at First Hearing

002 Passion in Action

Love at First Hearing

Data-informed UX/UI concept

Love at First Hearing is a mobile app concept that helps beginners discover Chinese traditional instruments through sound-first exploration, reducing the visual and technical barriers of instrument selection.

Quick facts

- Context: Tongji University, Information and Data Visualization course
- Team: 2 people
- Role: research, data visualization, UX/UI concept, interaction design
- Methods: dataset analysis, Tableau visualization, secondary research, concept design
- Output: mobile app and in-store experience concept

Research question

How can we encourage more people to discover and approach Chinese traditional instruments?

DATA-INFORMED DESIGN

UX/UI DESIGN

MOBILE EXPERIENCE

Research input

- Dataset of Chinese traditional instruments
- Classification by material, playing technique, geography, historical period
- Custom dataset on instruments in Chinese cinema
- Tableau visualizations

Key insights

Traditional instruments have rich cultural and emotional value, but they remain difficult for beginners to approach because discovery is often mediated by technical knowledge, visual familiarity or cultural distance.

Design pivot

The project shifted from analysing how instruments appear in film to designing a more intuitive entry point for discovery: sound.

How can we encourage people to discover and learn Chinese Traditional instruments?

Historical timeline of instrument origins across Chinese dynasties.

Network analysis mapping relations between composers, films and traditional Chinese instruments.

***“Hear first,
understand later”***

Digital experience

Sound-first discovery — users like or skip instruments before seeing their name.

Reveal and learn — once interested, users access history and details.

Save and compare — profile collects liked sounds and instruments.

Bridge to purchase — store locator connects digital discovery to physical stores.

In-store experience

Activating the app’s in-store mode triggers a spatial audio experience powered by proximity technology. As you walk through the shop, instruments automatically play in stereo when you approach and fade as you step away, mimicking natural acoustics. Standing between multiple instruments blends their sounds simultaneously based on your distance, recreating the layered atmosphere of a music store and letting you discover unexpected sonic combinations.

Passion in Action

Service design for sustainable banking

Passion in Action is a banking service concept designed to help Gen Z connect personal passions with social activities, goal planning and real-world rewards.

Quick facts

- Context: 8-day workshop with Flowe and Banca Mediolanum
- Team: 5 people
- Role: interaction flow design, onboarding, reward system UI, visual design
- Methods: secondary research, service blueprint, journey mapping, prototyping
- Output: mobile app prototype and final presentation

Research question

How can a bank support Gen Z in turning passions into meaningful, sustainable actions?

SERVICE DESIGN

UX/UI DESIGN

ENGAGEMENT DESIGN

Key research insights

Gen Z sees passions not only as hobbies, but as potential sources of income, identity and social impact.

75% of high school student would like to convert their hobbies into full-time jobs.

Informed the passion-to-income mechanic at the core of the service.

61% of high school student would rather be an entrepreneur than work for anybody else.

Shaped the bank's role as enabler rather than traditional financial provider.

46% of people have dedicated their free time for helping people of their community.

Validated the social activity model as the primary engagement mechanic.

Journey Map

Key UX decisions

Passion-first onboarding — creates personal relevance before banking actions.

Activity cards — show location, duration and points upfront.

Calendar commitment — turns intention into a concrete plan.

Reward system — reinforces progress and motivation.

What I learned

How to work within a fast design sprint

How to translate research into service mechanics

How to design onboarding and reward flows for engagement

BNP Paribas Fortis

UX Researcher Internship

During my internship at BNP Paribas Fortis, I supported the UX Research team by planning, moderating and analysing usability tests for B2C banking products, while also evaluating unmoderated testing tools for the department.

Quick facts

- Role: UX Researcher Intern
- Context: B2C banking app and website
- Team: UX Research department
- Methods: moderated usability testing, think-aloud, remote sessions, tool evaluation
- Tools: Webex, Maze, Excel/reporting tools
- Output: usability reports, severity-based insights, Maze proof of concept

Outcomes

- 20+ moderated usability sessions
- Step-by-step usability reports
- [Maze.co](#) Proof of Concept
- Brown Bag Session on Digital Sustainability

UX RESEARCH

USABILITY TESTING

B2C PRODUCT

STAKEHOLDER COLLABORATION

Project & Documentation Workflow

Planning

Reviewed prototypes with designers

Defined research goals

Prepared task-based scenarios

Aligned validation objectives

Moderation

Remote sessions via Webex

English/French moderation

Think-aloud protocol

Observation of hesitations and spontaneous comments

Analysis

Mapped findings to UI elements

Identified recurring patterns

Used severity scale

Delivered reports to design teams

From observation to recommendations

Observations

Users hesitated before completing a transfer step

Users misunderstood currency or transfer details

Users needed reassurance during sensitive banking flows

UX issues

Unclear hierarchy / trust issue

Information ambiguity

Emotional sensitivity around money

Recommendations

Clarify labels, reinforce confirmation feedback

Make key transaction details more visible

Add clearer feedback and reduce uncertainty

MAZE TESTING TOOL

Maze Overview

Maze is a remote testing platform designed with the purpose to have **instant and accessible insights** from **tailor-made, online tests**.

- 1 Remote Test
- Easy & Fast
 - Unique URL
 - Unmoderated
 - Templates gal

MAZE TESTING TOOL

Remote Testing

Up to 3 projects for the free version.
Possibility to collect insights starting from a template.

Discovery Project

MAX 10 BLOCK (free version)

Reporting

Online visualizations

Projects > SNIPP > 2018 APP - Account creation

Aggregated paths

Click to see the heatmap for each path

Screen metrics: average metrics recorded for the screen

- Misclick rating
- Time spent
- N° testers

Tester paths analysis include: user ID, date and time of test, outcome (Direct, Indirect, Give up), duration, misclick, misclick's pages, tester path heatmaps.

14

Tool evaluation

I did a benchmark research on unmoderated testing tools based on ease of use, required assets, quality of collected data and reporting capabilities. This led to a [Maze.co](https://maze.co) Proof of Concept using an existing prototype.

Digital sustainability

I also initiated an independent research project on Digital Sustainability, later presented in a Brown Bag Session to around 20 UX colleagues.

What I learned

How UX research works under corporate constraints

How to communicate findings to stakeholders

How to balance qualitative evidence and product priorities

How moderated and unmoderated methods can complement each other

Video call interface showing participants: Sacha Kocovski, Xavier R, Gaia Coradeschi.

Task 2: Envoyer de l'argent à votre fille qui est aux USA

Elle s'appelle Françoise Declerq et vous souhaitez envoyer 500€

(Astuce 1: Cliquez sur les champs que vous souhaitez remplir, certains se rempliront automatiquement)

(Astuce 2: Pour valider le virement cliquez sur l'image Face ID lorsqu'elle est proposée)

passer

Mobile app interface showing a transfer screen with fields for amount (500.00 EUR) and recipient (FRANCOISE DECLERQ).

Mobile app interface showing a confirmation screen with a heatmap overlay.

Into the Alzheimer's World

Design Guidelines for Immersive VR Experiences for People with Alzheimer's Disease

Overview

My master's thesis explored how immersive virtual reality experiences can be designed for people with Alzheimer's Disease, focusing on cognitive accessibility, emotional safety, orientation and interaction.

The goal was to move from clinical and contextual research to a practical framework of design guidelines for inclusive immersive experiences, tailored to users with cognitive impairments and their care context.

My role

Independent researcher and designer. I conducted literature review, field research, participant observation, interviews, synthesis and guideline definition.

Research question

How can immersive VR experiences support people with Alzheimer's Disease while reducing cognitive overload, disorientation and emotional distress?

UX RESEARCH **FIELD RESEARCH** **ACCESSIBILITY** **INCLUSIVE DESIGN**

Research process - a timeline

The research combined desk research and field research. First, I analysed Alzheimer's Disease, non-pharmacological therapies and existing immersive VR interventions. Then I conducted field research at Grace, a dementia-friendly daycare centre near Milan, through participant observation, shadowing and semi-structured interviews.

34 IMMERSIVE VR INTERVENTIONS REVIEWED

15–20 GUESTS OBSERVED

4 HEALTHCARE PROFESSIONALS INVOLVED

From field insights to design principles

Research insight

People with AD may experience frustration when they cannot remember, communicate or complete a task.

Downtime and passive moments can lead to boredom, restlessness or irritation.

Healthcare professionals need tools that adapt to changing needs and reduce management complexity.

Familiarity, personal history and emotional safety are central to engagement.

Group and dyadic activities can support socialization but require careful facilitation.

Design implication

Use simple instructions, error prevention and positive reinforcement.

Design meaningful, structured activities that support autonomy and engagement.

Include facilitator support, quick activity switching and caregiver-facing guidance.

Use personalized content, familiar environments, calming stimuli and avoid negative triggers.

Design shared experiences with flexible levels of participation.

The main design challenge was not to make VR more immersive, but to make it safer, clearer and more emotionally sustainable for users with cognitive impairments.
